This book examines the diverse use of visual representations by teachers in the science classroom. It contains unique pedagogies related to the use of visualization, presents original curriculum materials as well as explores future possibilities. The book begins by looking at the significance of visual representations in the teaching of science. It then goes on to detail two recent innovations in the field: simulations and slowmation, a process of explicit visualization. It also evaluates the way teachers have used different diagrams to illustrate concepts in biology and chemistry. Next, the book

Access Free Explore Learning Student

Exploration of visual representations in culturally diverse classrooms, including the implication of culture for teachers' use of representations, the crucial importance of language in the design and use of visualizations and visualizations in popular books about chemistry. It also shows the place of visualizations in the growing use of informal, self-directed science education. Overall, the book concludes that if the potential of visualizations in science education is to be realized in the future, the subject must be included in both pre-service and in-service teacher education. It explores ways to develop science teachers' representational competence and details the

Impact that this will have on their teaching. The worldwide trend towards providing science education for all, coupled with the increased availability of color printing, access to personal computers and projection facilities, has lead to a more extensive and diverse use of visual representations in the classroom. This book offers unique insights into the relationship between visual representations and science education, making it an ideal resource for educators as well as researchers in science education, visualization and pedagogy.

The ability to make realistic judgements of one's performance is a demonstration of the

Access Free Explore Learning Student

Exploration of strong
metacognitive skills.

Metacognition involves the monitoring of one's progress during learning, and the ability to modify learning strategies for increased effectiveness. Poor-performing students are at risk because they generally exhibit high levels of overconfidence when evaluating their performance, and may fail to adjust their learning strategies in time. This study aims to explore the accuracy with which students in the BSc Four-year programme (BFYP) of the University of Pretoria evaluate their performance in a stoichiometry test, as well as the influence of teaching on test performance and on accuracy of performance

Answers
Evaluation. The factors that students rely on when making performance evaluations as well as shifts in the reliance on these factors after teaching are explored. Finally, the study examines the relationship between bias in performance evaluation and the self-protection, self-enhancement motivational factors and gender. Data were collected by means of a three-tier stoichiometry test instrument, administered as pre- and posttest, as well as a questionnaire administered simultaneously with the pretests to a sample of 91 students. Each test item comprised a stoichiometry question, a confidence rating and a free-response explanation for the

Access Free Explore Learning Student

choice of confidence rating. The confidence rating was interpreted as an indication of expected performance. The test instrument allowed for the investigation of bias in performance evaluation in the pre- and posttests, the exploration of factors that students rely on when making performance evaluations and how the reliance on these factors shifted in the posttests. The questionnaires were used to collect data on self-enhancement, self-protection and gender. The study shows that the majority of the students were overconfident in the evaluation of their performance in both the pre- and posttests. Performance improved significantly in the posttest but accuracy of performance

Access Free Explore Learning Student

Answers
evaluation did not. Students were categorised as overconfident (OC), realistic (R) or underconfident (UC) based on the difference between actual and expected performance. Five subgroups were defined on the basis of accuracy of performance evaluation in the pre- and posttests. The five subgroups, labelled first by their pretest and then their posttest category, were the OC-OC (50 students), OC-R (13 students), R-R (11 students), R-OC (15 students) and the R-UC (2 students) subgroups. The results indicated no significant difference between the pre-knowledge and ability of the students in the four main subgroups. The students differed significantly in terms of

Access Free Explore Learning Student

performance in the posttest, their pre- and posttest average confidence scores and in performance gain. A significant difference was not found with regard to performance in the CMY 143 end of semester examination. These findings confirmed that we were dealing with four discrete subgroups with different characteristics. The OC-R subgroup achieved the highest learning gain by a significant margin. Moderate learning gains were demonstrated by the R-R and OC-OC subgroups and the R-OC subgroup did not achieve any learning gain at all. Careful analysis of qualitative data revealed that accuracy in the evaluation of posttest performance was associated with

Access Free Explore Learning Student

Exploration Stoichiometry

Answers

both a reduction in the prevalence of vague subjective judgments and with higher performance gain. Similarly, an increase in the tendency to base metacognitive monitoring on vague global judgments of performance in the posttest was associated with reduced accuracy of self-evaluation and lower learning gain. The tendency by the four performance evaluation subgroups to self-enhance or self-protect was not found to be statistically different. P-values greater than 0.05 in the pre- and posttests indicated that males and females were not significantly different in their accuracy of performance evaluation. The study suggests that an element of bias in performance evaluation

Access Free Explore Learning Student

may be beneficial to learning. Inaccuracy in self-evaluation in the pretest did not hamper learning for both the OC-OC and OC-R subgroups. Students who were over-optimistic about their performance in the pretest may have been less intimidated by the challenges of the new content material than those who were better calibrated (R-R and R-OC subgroups). Students who remained overconfident in the posttest, i.e. in the OC-OC subgroup did not gain from the learning experience as much as those who entered overconfident but became better calibrated. Those who entered tentatively as realists and then, with a little exposure, became unrealistic in their performance evaluation

Exploration Stoichiometry

were shown to be the most vulnerable based on their lack of learning gain. Furthermore, increasing content knowledge alone may not be enough to raise the metacognitive ability of students. Finally, chemistry educators should be aware that students often make vague subjective judgements of performance even on a topic like stoichiometry, which requires predominantly procedural knowledge and formal reasoning. Our study has shown that this deficiency, when associated with poor accuracy of self-evaluation, may hamper learning gain. Copyright.

This comprehensive collection of top-level contributions provides a

Access Free Explore Learning Student

Thorough review of the vibrant field of chemistry education.

Highly-experienced chemistry professors and chemistry education experts at universities all over the world cover the latest developments in chemistry learning and teaching, as well as the pivotal role of chemistry for shaping the future world.

Adopting a practice-oriented approach, they offer a critical view of the current challenges and opportunities of chemistry education, highlighting the pitfalls that can occur, sometimes unconsciously, in teaching chemistry and how to circumvent them. The main topics discussed include the role of technology, best practices, science visualization, and project-based

education. Hands-on tips on how to optimally implement novel methods of teaching chemistry at university and high-school level make this is a useful resource for professors with no formal training in didactics as well as for secondary school teachers.

This volume is of interest to science educators, graduate students, and classroom teachers. The book will also be an important addition to any scholarly library focusing on science education, science literacy, and writing. This book is unique in that it synthesizes the research of the three leading researchers in the field of writing

Access Free Explore Learning Student

to learn science: Carolyn S. Wallace, Brian Hand, and Vaughan Prain. It includes a comprehensive review of salient literature in the field, detailed reports of the authors' own research studies, and current and future issues on writing in science. The book is the first to definitely answer the question, "Does writing improve science learning?". Further, it provides evidence for some of the mechanisms through which learning occurs. It combines both theory and practice in a unique way. Although primarily a tool for research, classroom teachers will also find many practical suggestions for using writing in the science classroom.

This book is open access under a CC BY 4.0 license. This open access book examines the modern role of the European School system within the European Union, at a time when the global economy demands a

Access Free Explore Learning Student

new vision for contemporary education. The European schools are currently in a state of crisis: their 60-year-old tradition of bilingual and multilingual education is being strained by rapid EU expansion and the removal of English speaking teachers as a result of Brexit. Their tried and tested model of mathematics and science education has rapidly been overtaken by new developments in pedagogy and assessment research, while recruitment and retention of students and teachers has become increasingly fraught as European member states review what they are, and what they are not, prepared to fund. The authors draw on original and empirical research to
