Direct-driven fan drives require large tip clearance to allow for independent movement between the engine and radiator assembly. This large tip clearance reduces the efficiency of the cooling air flow across the radiator by as much as 10-15% compared to a hydraulic fan drive system where the fan motor, fan and radiator are attached to each other.

Gearmotor RPM Range is a grouping to help with motor selection. When selecting a gearmotor, choose an RPM Range that contains the desired gearmotor's nameplate rpm (revolutions per minute). The Gearmotor RPM Range does not indicate that a motor is capable of variable speed operation.

AC Gearmotors - Grainger Industrial Supply

Sometimes the goal of using a gear motor is to reduce the rotating shaft speed of a motor in the device being driven, such as in a small electric clock where the tiny synchronous motor may be spinning at 1,200 rpm but is reduced to one rpm to drive the second hand, and further reduced in the clock mechanism to drive the minute and hour hands.

HVAC AC motors are used in equipment such as fans, blowers, pumps, air conditioners, heaters, and compressors. Direct drive blower and belt drive HVAC AC motors circulate air in roof ventilators and air circulators.

Underground Electric Haulage focuses on the locomotives used in modern mine railways. The locomotives of many different types are used for such underground operations as gathering at the loading points, shunting at the pit bottom, hauling man-riding vehicles, but primarily hauling material cars on the main haulage roads of the mine. The locomotives for underground haulage fall into three main groups: (1) compressed-air locomotives, (2) internal-combustion locomotives, and (3) electric locomotives. So far as electric haulage is concerned, the locomotives may be divided into two types: (a) trolley locomotives and (b) storage-battery locomotives. Besides these two main types there are also various combinations, such as trolley locomotives with batteries, cable-reel locomotives with a reel for the automatic unwinding and winding up of the cable, and trolley locomotives fitted additionally with the cable-reel equipment. The book is organized into three parts. Parts I and II discusses trolley locomotives and storage-battery locomotives, respectively, while Part III deals with calculations in mine traction engineering.
