Cheaper film Leica's you can start off with include the Leica M4 (built like the M6, but doesn't have a meter) and Leica M5 (body styling is different, but still a good camera). If you don't want to bother with film, want a Leica, and might be more on a budget—I'd recommend a second-hand Leica M8 or Leica M9 (for the rangefinder 'experience').

It is generously endowed with enough fundamentals to satisfy the technical specialist, without intimidating the casual but curious amateur photographer. The author has repaired, modified, and designed and analyzed cameras for the past forty five years. With this background, he goes beyond describing camera functions based on advertised data, instead the book explains how various cameras really work. The book peels off the cover panels and lets you look into the dark side of the lens. The dozen or so formulas use simple math and the drawings alone are worth the price of admission. Describes how cameras work and how well they overcome the difficulties in making a technically perfect photo Covers causes of image faults Presents unique methods for testing cameras Covers integration of optics, electronics, and mechanics in contemporary cameras

The Leica M system has been with us since 1954. It rapidly became, and has remained the favorite instrument of photographers, especially photojournalists, who, like Henri Cartier-Bresson, seek to ""catch life in the act"", to record ""the decisive moment"". In this Leica M Compendium Jonathan Eastland describes the whole Leica M system from his experience as a professional photographer. He explains how to use, enjoy and get the best out of the cameras and lenses, regardless of age. The latest lenses can be used on the earliest cameras, and vice-versa, and the Visoflex, although no longer made, is now much easier to use with the M6 and its TTL metering. Advice on planning and shooting a story with the Leica and extensive tables of technical data complete this ideal companion for the practical Leica M photographer, as well as for the Leica collector and enthusiast.

Just over 100 years ago, 16-year-old Ludwig J. Bertele began an apprenticeship as an optical designer in Munich. The potential of this young man, so interested in mathematics, did not go unnoticed for long. At the age of only 20, he stunned the experts with an innovative optical design that was surprisingly powerful for that time. This fast, high-resolution lens made it possible to photograph indoors without flash and tripod for the first time. As a result, a well-equipped camera became the basis for the success of numerous famous photographers. The work of Ludwig J. Bertele played a key role in the rapid development of geometrical optics and thus photography after the First World War. Later, his designs also set new standards in aerial photogrammetry and other specialized fields of optics. This book tells the life story of an exceptionally talented man, autodidact and master of lens element combinations, who repeatedly set important impulses in optics research.

Expert advice for turning old cameras into valuable collectibles, these step-by-step instructions show how to restore a vintage camera. Learn to work on antique leather, brass, and wooden components to achieve a complete camera restoration.

8 1/2 x 10 Since publication this title has proved to be very popular for both the serious lens user wishing to understand more about his lenses, as well as the Leica enthusiast considering which lens would be suitable to add to his outfit. Do you know your "Coma from your Aberrations"? If "Yes," then part 2 of Erwin Puts' new book will be of considerable interest to you. Either way you may find this section easier to understand than you expect; the illustrations and diagrams do help. Part 1 goes into the optical history of E. Leitz, Wetzlar and the Leica Camera of Solms in detail with all the personalities involved. This section is well illustrated with some new pictures. The commercial demands are always battling with the perfectionists at Leica who created some of the world's most famous lenses. Part 2 is an optical digression explaining the lens and glass design features, problems and terms and the continual battle to ensure that Leica users end up with the highest possible standard of lens. Part 3 is the largest part of the book. Puts has tested Leica lenses from 1925 to date; each lens, in most cases with diagram, is detailed with its performances at the critical apertures.
