Moving average convergence divergence (MACD) is one of the most commonly used technical analysis indicators. It is a trend-following momentum indicator, meaning it looks at an asset's momentum to ascertain whether the trend is up or down, and as such can be used to provide trading signals and identify trading opportunities. How does MACD work?

MACD divergence seems like a good tool for spotting reversals. It is inaccurate, untimely information produces many false signals and fails to signal many actual reversals.

Traders are better off focusing on the price action, instead of divergence. For a downtrend to reverse, the price must make a higher swing high and/or a higher swing low.

Convergences / Divergences

One of the most powerful technical indicators that you can use in any market is the MACD oscillator, invented by Gerald Appel in 1979. The MACD, which is short for moving average convergence divergence, is one of the most popular lagging indicators among traders as well. Many traders use this indicator to trade divergence between the indicator and price, which can be a powerful trading technique if done correctly.

MACD Trading - Moving Average Convergence Divergence?

First, the MACD employs two Moving Averages of varying lengths (which are lagging indicators) to identify trend direction and duration. Then, it takes the difference in values between those two Moving Averages (MACD Line) and an EMA of those Moving Averages (Signal Line) and plots that difference between the two lines as a histogram which oscillates above and below a center Zero Line.
