Reduced performance, e.g. longer cycle times or slow operation, is often an early indication of problems within the hydraulic system. Flow determines actuator speed and response in a hydraulic system. A loss of speed therefore indicates a loss of flow. Inconsistent, erratically moving actuators are a strong sign of entrapped air.

Step 1 - Pump Inlet Strainer. Probably the field trouble encountered more often is cavitation of the hydraulic pump inlet caused by dirt build-up on the inlet strainer. This can happen on a new system after only a few hours operation as well as on a system which has been in service for a long time.
